

CLAIMS

The following listing of claims will replace all prior versions and listings of claims in the application.

LISTING OF CLAIMS

22. (New) An armature shaft comprising:

a shaft having two ends;

a commutator on said shaft;

at least one bearing on said shaft, said bearing adjacent one of said ends of said shaft, said bearing having a central bore sized to support said shaft during rotation, said central bore having an enlarged portion opening towards said one end of said shaft, said bearing having an annular portion defining said enlarged portion and said annular portion having a desired depth with a bottom surface; and

a retainer on said shaft for retaining said bearing on said shaft, said retainer positioned within said enlarged bore portion of said bearing and said retainer having a desired depth such that one side of said retainer being flush with said one shaft end and another side of said retainer seating on said bottom surface for registering said bearing on said shaft.

23. (New) The armature shaft according to Claim 22, wherein a bearing housing surrounds said bearing, said housing adapted for fixing with a motor end plate.

24. (New) The armature shaft according to Claim 23, wherein said bearing housing having a receiving bore for receiving said bearing, said receiving bore having a stepped configuration.

25. (New) The armature shaft according to Claim 24, wherein said bearing has an outer surface with a step configuration for seating with said bearing housing.

26. (New) The armature shaft according to Claim 22, wherein said bearing and said retainer being flush with said shaft end.

27. (New) The armature shaft according to Claim 22, wherein a washer separates said bearing from said commutator.

28. (New) The armature shaft according to Claim 22, wherein said enlarged bore portion defines an abutting shoulder, said retainer abutting said shoulder.

29. (New) An electric motor comprising:

a stator assembly;

an armature shaft rotatable within said stator assembly;

a commutator rotatable with said armature and connected to said armature via a shaft;

brushes associated with said commutator, said brushes held in an end plate;

at least one bearing on said shaft, said bearing adjacent one of said ends of said shaft, said bearing having a central bore sized to support said shaft during rotation, said central bore having an enlarged portion opening toward said one end of said shaft, said bearing having an annular portion defining said enlarged portion and said annular portion having a desired depth with a bottom surface; and

a retainer on said shaft for retaining said bearing on said shaft, said retainer positioned within said enlarged bore portion of said bearing and said retainer having a desired depth such that one side of said retainer being flush with said one shaft end and another side of said retainer seating on said bottom surface for registering said bearing on said shaft; and

a bearing at the other end of said shaft.

30. (New) The electric motor according to Claim 29, wherein a bearing housing surrounds said bearing, said housing fixed with said end plate.

31. (New) The electric motor according to Claim 30, wherein said bearing housing having a receiving bore for receiving said bearing, said receiving bore having a stepped configuration.

32. (New) The electric motor according to Claim 31, wherein said bearing has an outer surface with a step configuration for seating with said bearing housing.

33. (New) The electric motor according to Claim 29, wherein said bearing and said retainer being flush with said shaft end.

34. (New) The electric motor according to Claim 29, wherein a washer separates said bearing from said commutator.

35. (New) The electric motor according to Claim 29, wherein said enlarged bore portion defines an abutting shoulder, said retainer abutting said shoulder.

36. (New) A power tool comprising:

a housing;

a stator assembly;

an armature rotatable within said stator assembly;

a commutator rotatable with said armature and connected to said armature via a shaft;

brushes associated with said commutator, said brushes held in an end plate;

at least one bearing on said shaft, said bearing adjacent one of said ends of said shaft, said bearing having a central bore sized to support said shaft during rotation, said central bore

having an enlarged portion opening toward said one end of said shaft; said bearing having an annular portion defining said enlarged portion and said annular portion having a desired depth with a bottom surface;

a retainer on said shaft for retaining said bearing on said shaft, said retainer positioned within said enlarged bore portion of said bearing and said retainer having a desired depth such that one side of said retainer being flush with said one shaft end and another side of said retainer seating on said bottom surface for registering said bearing on said shaft;

a bearing at the other end of said shaft;

a power source electrically coupled with said motor;

an activation member electrically coupled with said motor and said power source for energizing and de-energizing said motor; and

an output coupled with said motor for driving a tool.

37. (New) The power tool according to Claim 36, wherein a bearing housing surrounds said bearing, said housing fixed with said end plate.

38. (New) The power tool according to Claim 37, wherein said bearing housing having a receiving bore for receiving said bearing, said receiving bore having a stepped configuration.

39. (New) The power tool according to Claim 38, wherein said bearing has an outer surface with a step configuration for seating with said bearing housing.

40. (New) The power tool according to Claim 36, wherein said bearing and said retainer being flush with said shaft end.

41. (New) The power tool according to Claim 36, wherein a washer separates said bearing from said commutator.

42. (New) The power tool according to Claim 36, wherein said enlarged bore portion defines an abutting shoulder, said retainer abutting said shoulder.
